## Abstract of the Disclosure

A method is for referencing data records which include therapeutic advice items, in which each data record associated with a therapeutic advice item includes a unique order feature which is likewise stored together with a therapeutic information item based on the therapeutic advice item. Further, a therapeutic advice item being updated prompts all of the therapeutic information items to be searched for the order feature of the updated therapeutic advice item. A report, indicating the change in the underlying therapeutic advice item is then output for each therapeutic information item found in the process.
